Java Arraylist

Sometimes it's better to use dynamic size arrays. Java's Arraylist can provide you this feature. Try to solve this problem using Arraylist.

You are given n lines. In each line there are zero or more integers. You need to answer a few queries where you need to tell the number located in y^{th} position of x^{th} line.

Take your input from System.in.

Input Format
The first line has an integer n. In each of the next n lines there will be an integer d denoting number of integers on that line and then there will be d space-separated integers. In the next line there will be an integer q denoting number of queries. Each query will consist of two integers x and y.

Constraints

$1<=n<=20000$
$0<=d<=50000$
$1<=q<=1000$
$1<=x<=n$

Each number will fit in signed integer.
Total number of integers in n lines will not cross 100000.

Output Format
In each line, output the number located in y^{th} position of x^{th} line. If there is no such position, just print "ERROR!"

Sample Input

```
5
5 41 77 74 22 44
1 12
4 37 34 36 52
0
3 20 22 33
5
1 3
3 4
3 1
4 3
5 5
```

Sample Output

```
74
52
37
ERROR!
ERROR!
```
